```
public class Calculator {

   private int total;

   public Calculator() {
      this.total = 0;
   }
   void reset() {
      this.total = 0;
   }

   void sum(int number) {
      if  (number > 0) {
         this.total += number;
      } else {
         throw new IllegalArgumentException("Negative numbers are not allowed.");
      }
   }

   public int getTotal() {
      return this.total;
   }

   public static void main(String[] args) {
      Calculator calculator = new Calculator();
      calculator.reset();
      calculator.sum(1);
      calculator.sum(2);
      calculator.sum(3);
      calculator.sum(4);
      calculator.sum(5);
      calculator.sum(6);
      calculator.sum(7);
      System.out.println(calculator.getTotal());
   }

}
```

GitHub Copilot assisted in writing this code by:

- **Autocompleting method stubs**: As I typed public class Calculator, Copilot suggested the constructor and method outlines based on common patterns.
- **Suggesting exception handling**: When I began writing the sum method, Copilot proposed a conditional check for negative values and the use of IllegalArgumentException, which I accepted.
- **Generating the** main **method**: Copilot inferred the intent to test the class and suggested a sequence of sum calls followed by a System.out.println.
